Amendments to the Claims:

- 1. (Canceled)
- (New) A microelectromechanical (MEMS) structure on a substrate, comprising:

 an actuator body connected with a suspension system; and
 the suspension system connected with the substrate, the suspension system comprising:
 - a set of one or more flexures, each flexure connecting the actuator body with the substrate; and
 - a set of one or more torsional elements, wherein each torsional element connects a corresponding flexure with the actuator body and provides strain relief between the corresponding flexure and the actuator body.
- 3. (New) The MEMS structure of claim 2, wherein each torsional element relieves angular strain caused by a difference between the angle of the corresponding flexure and the angle of the actuator body.
- 4. (New) The MEMS structure of claim 2, wherein each torsional element has an angle of twist per unit moment (θ /Nm) of 7.00E+06 or greater.
- 5. (New) The MEMS structure of claim 2, wherein each torsional element has a length dimension that extends from the corresponding flexure to the actuator body, the length dimension having a value equal to or greater than 5 µm.
- 6. (New) The MEMS structure of claim 2, wherein each torsional element has a width dimension that extends perpendicular to the length dimension and substantially parallel to the substrate, the width dimension having a value equal to or greater than 2μm and less than 10μm.
- 7. (New) The MEMS structure of claim 2, wherein a torsional element comprises a torsional attachment or a torsional spring.

- 8. (New) The MEMS structure of claim 2, wherein a torsional element is shaped in a serpentine form.
- 9. (New) The MEMS structure of claim 2, wherein:

the suspension system further comprises a set of one or more anchor points, wherein each anchor point connects a corresponding flexure to the substrate and has an angle of twist per unit moment value substantially equal to a first value; and

cach torsional element has an angle of twist per unit moment value substantially equal to a second value, wherein the second value is greater than the first value.

10. (New) The MEMS structure of claim 2, wherein the actuator body is a platform, actuator segment, or mirror segment.
